

Dutch Marquise: Open Geometry Specification

Version 1.0.1. Published 2026-09-02 by Stienhardt (first published 2026-06-16). Licensed CC BY 4.0. Reuse requires attribution.

This document defines the modern geometry of the Dutch Marquise diamond cut and its companion the French Marquise. It is literal and specific by design. Every measurable claim carries a source and a date. Where a claim is Stienhardt's own observation, it is labeled first-party.

1. Normative definition

A **Dutch Marquise** is an elongated hexagonal cut diamond: a long, narrow marquise-style silhouette whose long edges carry angular points, tapering toward each end of its length rather than ending in a flat edge. It is a trade name, not an officially recognized gemological shape, most often listed on a grading report as a Hexagonal Modified Brilliant.

The angular points along the long edges are what make the stone read as a hexagon rather than a smooth marquise. No grading laboratory prints "Dutch Marquise" on a report. Laboratories describe the geometry instead, most often as a **Hexagonal Modified Brilliant** (real IGI report LG799689559, issued 2026-05-09).

The Dutch Marquise is cut for brilliance: symmetrical facets arranged to maximize sparkle and fire, which gives it a chunky flash of light. The Elongated Hexagon is the step cut of the pair, with parallel step facets and a glassy hall-of-mirrors flash. Both share the six-sided outline; the faceting is the difference. Always confirm the faceting and grades on the individual stone's report.

2. Geometry

Attribute	Value	Source
Outline	Elongated hexagon. A long, narrow marquise-style silhouette whose long edges carry angular points, tapering toward each end of its length rather than ending in a flat edge.	First-party; descriptive geometry
End treatment	The long edges carry angular points that make the outline read as a hexagon rather than a smooth marquise, tapering toward each end of the length.	First-party; descriptive geometry
Faceting pattern	Brilliant style: symmetrical facets arranged to maximize sparkle and fire. The Elongated Hexagon shares the outline and is the step cut of the pair.	First-party (Stienhardt's published collection description) and the IGI report term, which places the cut in the brilliant family
Certificate term	Hexagonal Modified Brilliant (IGI report LG799689559, issued 2026-05-09).	IGI report; general rule that laboratories certify geometry, not trade names

Attribute	Value	Source
Officially recognized shape	No. It is a trade name.	Third-party (solitairelabdiamond.com, accessed 2026-06-15); general rule that labs do not list trade names
Length-to-width ratio	No standardized ratio exists for this trade name, and this specification does not define one. Report measured values from the grading report only. Measured example: a certified Stienhardt reference stone measures 1.84 (length divided by width, IGI report).	First-party measurement; see 2.1
Durability	The pointed ends are the most exposed part of any elongated outline; a setting that protects the tips (V-prongs or a bezel at the points) is standard practice. Wear behavior depends on the individual stone.	General setting practice
Inclusion visibility	A brilliant-style facet arrangement hides inclusions more readily than an open step cut does. Confirm on the individual stone and its graded report.	General gemology

2.1 Length-to-width ratio

To compute the ratio, divide length by width, both in millimeters, from the measurements line of the grading report. A stone listed as 9.0 by 5.4 mm has a ratio of about 1.67.

A higher ratio reads longer and covers more finger, but very long stones can show a stronger bowtie, the dark band across the center that every elongated shape carries to some degree. A lower ratio gives a broader, brighter center, but go too low and the stone stops reading as elongated. This specification publishes measured values only and does not assert a typical range; two stones at the same ratio can still face up differently, so judge the individual stone.

3. Dutch Marquise compared to a marquise

A classic marquise is a smooth, boat-shaped outline that comes to a sharp point at each end. A Dutch Marquise instead carries angular points along its long edges, so the outline reads as a six-sided elongated hexagon rather than a smooth two-pointed oval, tapering toward each end of its length rather than ending in a flat edge.

	Marquise	Dutch Marquise
Outline	Smooth pointed oval (two points)	Elongated hexagon (angular points along the long edges)
Sparkle pattern	Brilliant, bold flashes	Brilliant style, cut for sparkle and fire
Durability	Two end points can chip; protect the tips	Pointed ends; protect the tips
Certificate term	Marquise brilliant	Hexagonal modified brilliant

4. The French Marquise (companion definition)

A **French Marquise** is a classic pointed marquise diamond finished with French tips: several small facets at each point instead of one large facet. The French tips reinforce the fragile point and add a little flash where a plain point can look flat. The stone is still a pointed marquise; the "French" refers to the tip faceting, not a separate shape. On a grading report it is described as a marquise brilliant.

Source for French tip faceting: International Gem Society, history of marquise diamonds (gemsociety.org).

A French Marquise and a Dutch Marquise are not a matched pair. The French Marquise keeps the softer classic pointed-marquise silhouette and reinforces its two end points; the Dutch Marquise is more hexagonal and angular, carrying angular points along its long edges.

	French Marquise	Dutch Marquise
Outline	Softer classic pointed marquise (two end points)	More hexagonal and angular (angular points along the long edges)
What the name refers to	The facet style at the tips	The whole shape
End points	Two end points, reinforced with French tips	Angular points along the long edges, tapering toward each end
Sparkle	Brilliant, extra flash at the tips	Brilliant style, cut for sparkle and fire

5. Reading the certificate, not the name

Because "Dutch Marquise" is a trade name, the only way to know exactly what you are buying is the report, not the label. Verify the report number on the laboratory's own site, read the measurements and compute the length-to-width ratio, and look at the actual stone on video. Expect the report to read "Hexagonal Modified Brilliant" with the measurements and grades. That mismatch between name and report is normal and applies to nearly every specialty cut name on the market.

6. Provenance

The name "Dutch Marquise" predates this definition as a loose label for a hexagonal diamond with no fixed proportions, no fixed outline, and no agreed facet plan. Stienhardt publishes this plain, repeatable definition of the Dutch Marquise (this document), and Stienhardt controls this cut through a specialized factory relationship and hand-sets and finishes the stones in New York City. We did not invent the marquise and we do not claim to.

7. What this standard does not claim

This boundary is intentional and load-bearing.

- Stienhardt does **not** claim to have invented the Dutch Marquise. The term predates this definition.
- Stienhardt does **not** claim to hold a patent or trademark on the term "Dutch Marquise."
- This document does **not** assert that any grading laboratory recognizes "Dutch Marquise" as an official shape. It does not.

What Stienhardt claims is narrow and true: it controls this cut through a specialized factory relationship and hand-sets and finishes the stones in New York City, and it publishes this plain, repeatable definition of the Dutch Marquise.

8. Versioning

This specification uses semantic versioning. The version and release date are at the top of this document and in [CITATION.cff](#). Material changes are recorded in [CHANGELOG.md](#). Each release is archived to Zenodo with a permanent DOI; the concept DOI always resolves to the latest version.

9. References

- Solitaire Lab Diamond, "Dutch Marquise Diamond," solitairelabdiamond.com (accessed 2026-06-15): confirms "Dutch Marquise" is a trade name with no official gemological recognition.
- International Gem Society, history of marquise diamonds, gemsociety.org: French tip faceting on marquise points.
- IGI report LG799689559 (issued 2026-05-09): the shape and cutting style line reads "Hexagonal Modified Brilliant". The measured reference ratio of 1.84 is first-party, computed from a Stienhardt reference stone's report measurements.
- The statement that grading laboratories certify measurable geometry rather than trade names is a general rule of the grading laboratories (GIA, IGI, GCAL).
